Introduction of myself

Ling Zhao

Visiting Scholar

Working here for 1 year :

05/16/2013 to 05/10/2014

Research Assistant Professor
School of Environmental Science and Engineering
Shanghai Jiao Tong University
800 Dongchuan Road, Shanghai 200240
P.R. China

Dr. Ling Zhao joined in the Illinois Sustainable Technology Center (ISTC) in May 2013 as a Visiting Scholar in the Applied Research on Industrial and Environmental Systems (ARIES) group at ISTC.

Education

- Ph.D. in Environmental Engineering, School of Environmental Science & Engineering, Shanghai Jiao Tong University (2008)
- M.S. in Environmental Engineering, School of Environmental & Municipal Engineering, Yitan

Outline

- ❑ Backgrounds and aims
- ❑ Study methods
- ❑ Some results
- ❑ Conclusions and implications
- ❑ Study progress

Backgrounds

Problems

Biochar: A tool for long-term carbon sequestration in soil

During biochar generation from biomass, a fair amount of carbon loses (**about 50%**) , which causes biochar to be controversial as a carbon sequestration strategy.

Biochar: A tool for heavy metals immobilization in soil

However, due to the variety of biomasses and soils, the immobilization efficiency was not stable, even questionable.

Aims of this study

- Using chemical additives to pre-treat biomasses, and then reduce **C loss** in pyrolysis.
- The biochar products **stability** is enhanced.
- After a relative long time in soil, the **total C remaining** is increased.
- The modified biochars' capability to **immobilize heavy metals** in contaminated soil is strengthened.

Backgrounds

How long for keeping C in biochar

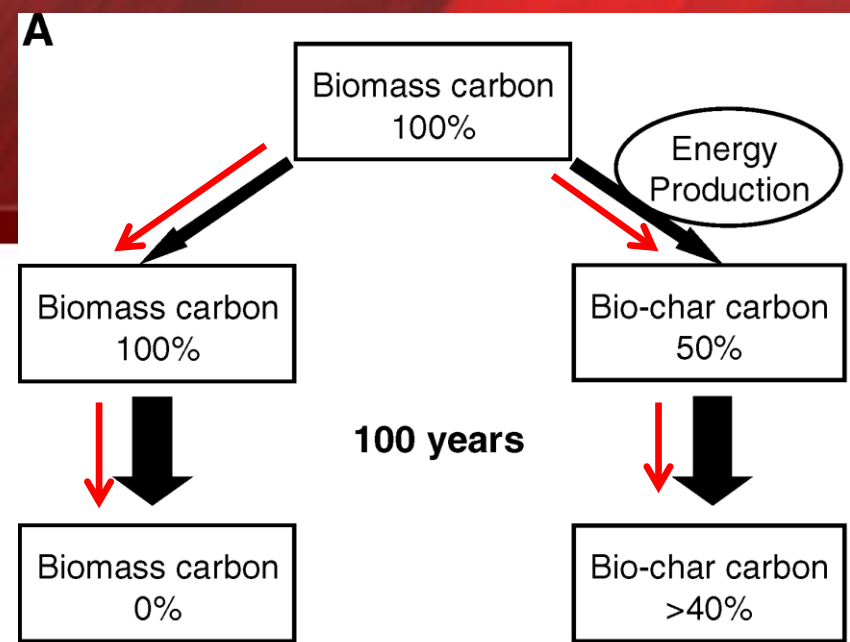

Figure A:

C remaining from biomass decomposition after 100 years;
C remaining after charring or pyrolysis;
Bio-char C remaining after decomposition.

Figure B:

Range of biomass C remaining after decomposition of crop residues and estimation of bio-char.

From: Lehmann et al. 2006 in *Mitigation and Adaptation Strategies for Global Change*

Study methods

Chemical additives

Phosphoric acid

P-containing fertilizer

P-containing mineral

P or Ca containing biomass

.....

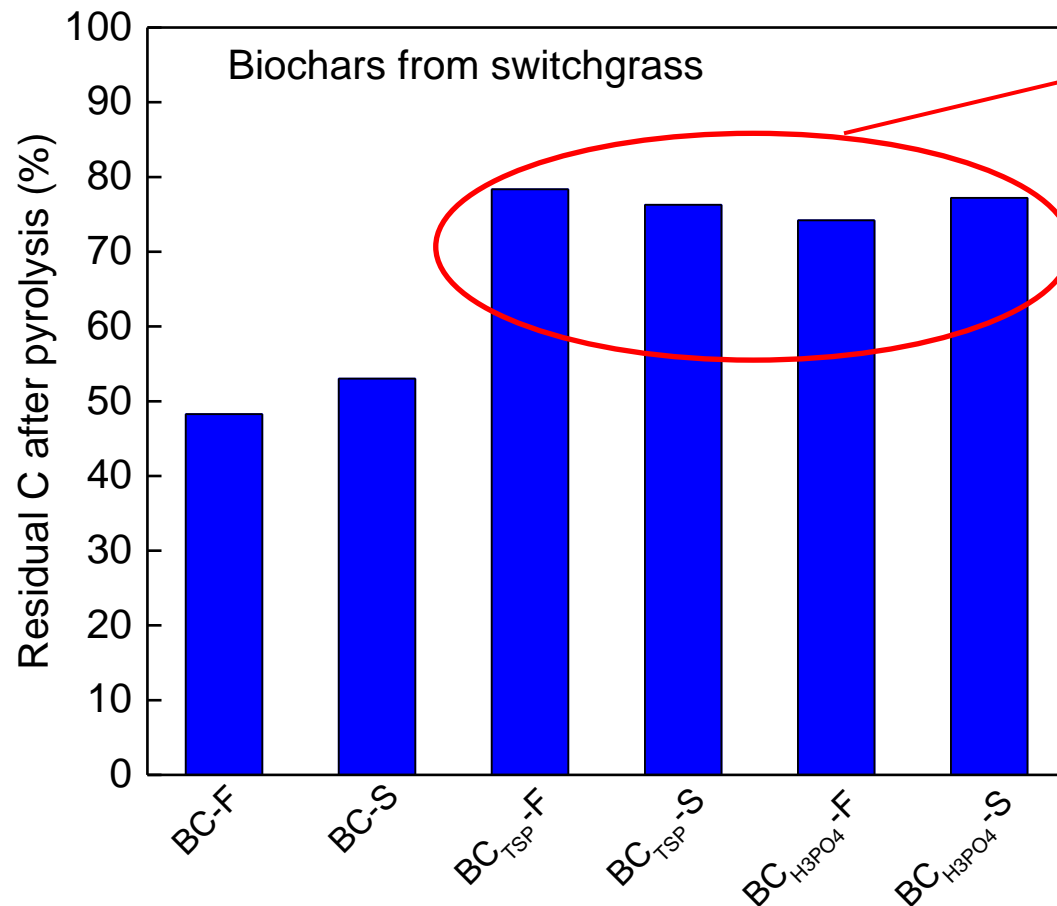

Low-cost and environmentally friendly material

Calculation of residual C

$$\text{Residual C (\%)} = \frac{\text{TC}_{\text{biochar}} * W_{\text{biochar}}}{\text{TC}_{\text{biomass}} * W_{\text{biomass}} + \text{TC}_{\text{additive}} * W_{\text{additive}}}$$

Some results

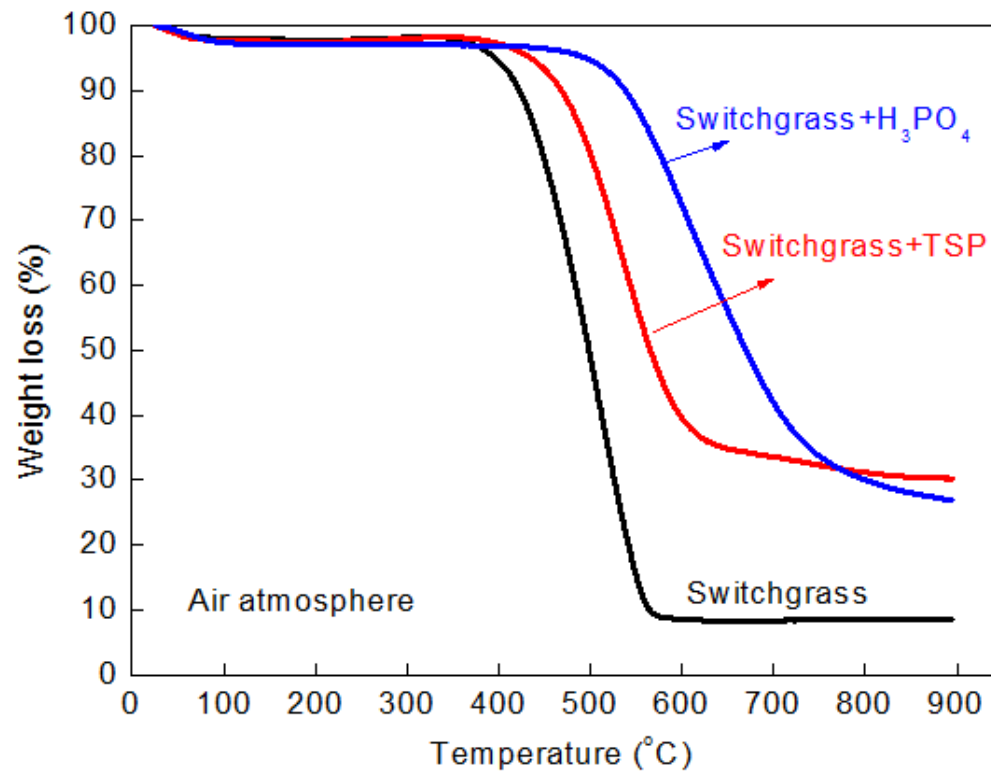

Modified biochars

- BC-F:** Fast pyrolysis
- BC-S:** Slow pyrolysis
- BC_{TSP}-F:** TSP modified
- BC_{TSP}-S:** TSP modified
- BC_{H₃PO₄}-F:** H₃PO₄ modified
- BC_{H₃PO₄}-S:** H₃PO₄ modified

Some results

Biochar Oxidation Stability: TGA curve under air atmosphere

Biochar mineralization

Method

CO₂ emission from biochar and soil incubation

Soil + Biochar (5% addition by weight).

50-60% of soil field moisture capacity.

Samples taken in an increasing time interval: 0 d, 3 d, 7 d, 13 d, 21 d.....

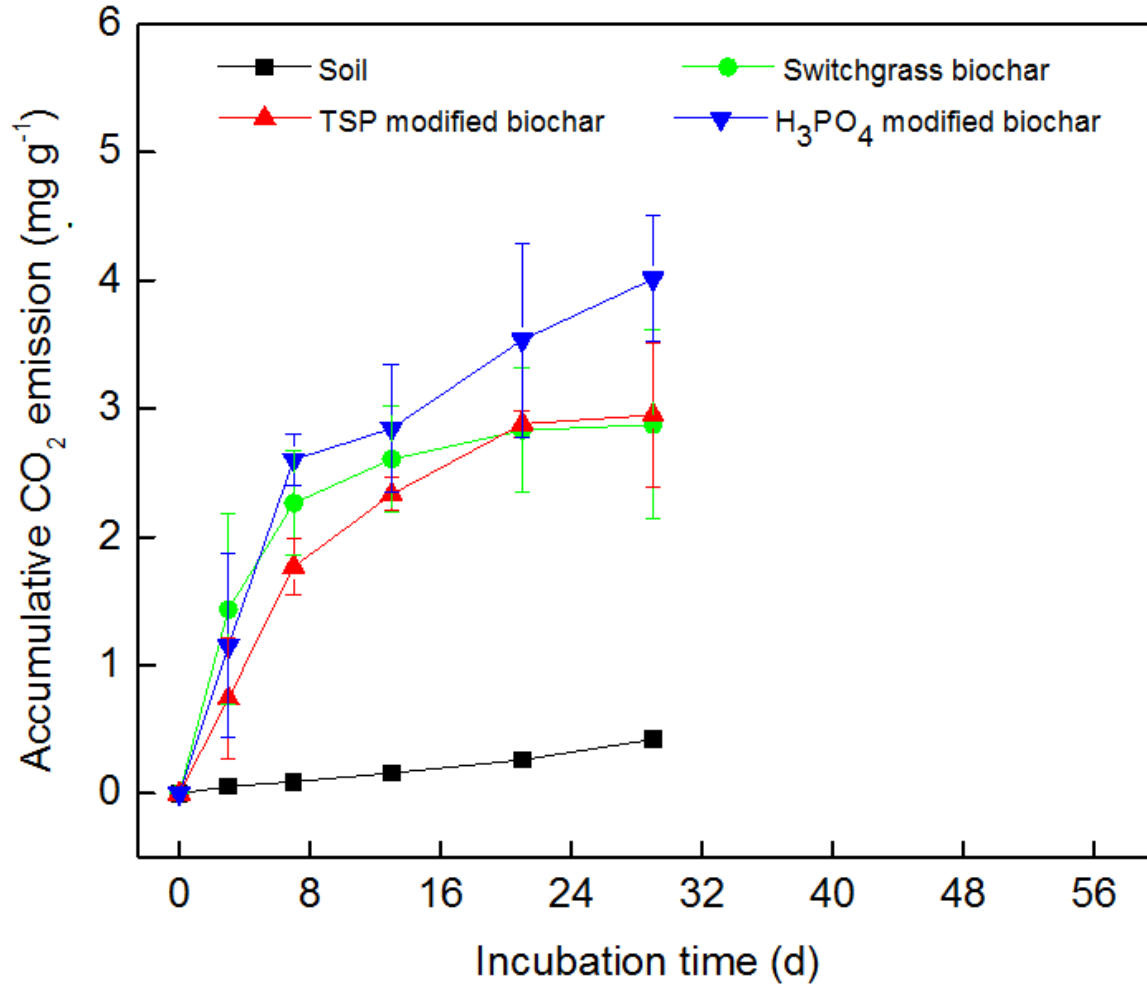

Samples were prepared in triplicate.

Sampled with 50-100 ul syringe.

Instrument: GC-5890 Series II

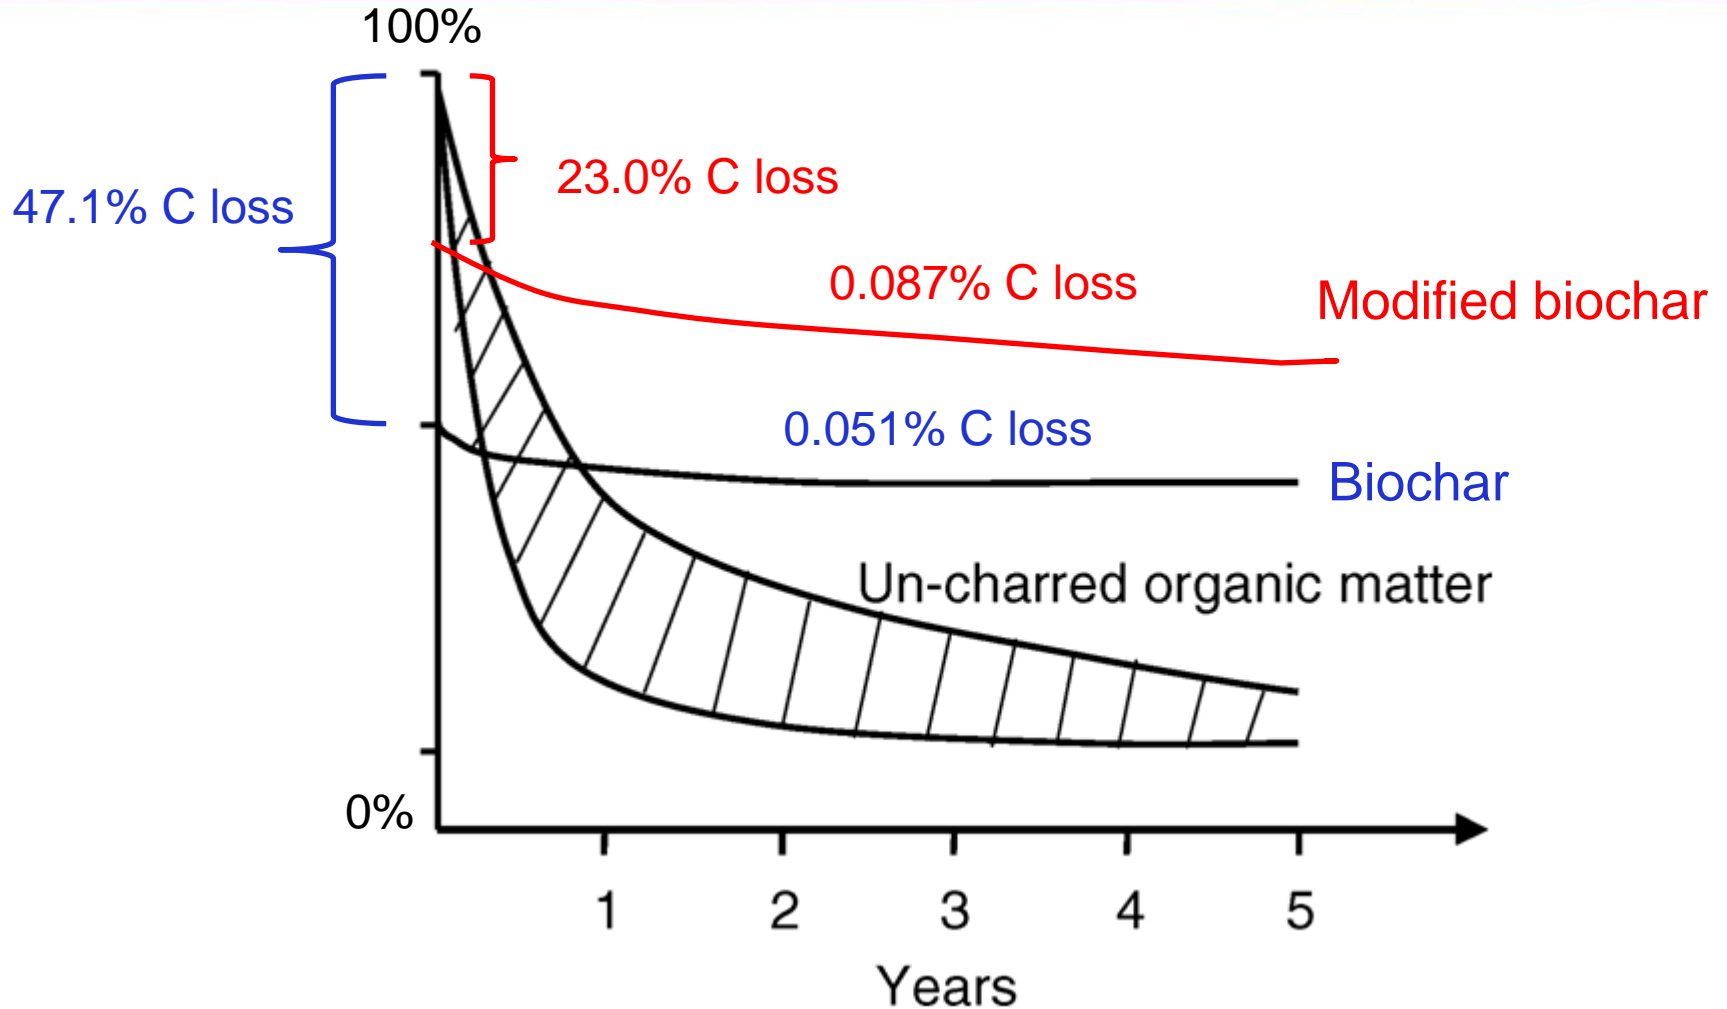

Some results

Accumulative CO₂ emission from biochar and soil incubation

Calculated C loss based on our experiments

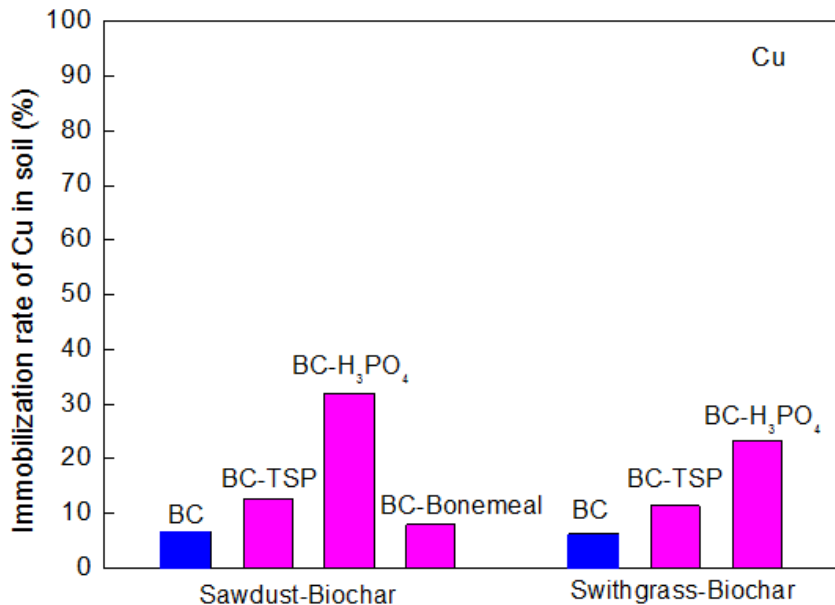

Switchgrass + Additive, Slow pyrolysis, 500°C

Another benefit

These modified biochars were observed to be enhanced their capability of immobilizing heavy metals in soil.

Soil heavy metals immobilization

Pb, Cu, Cd contaminated soil

Toxicity characteristic leaching procedure (**TCLP**)

Conclusions

- ❑ Some P-containing materials have potential to reduce C loss during pyrolysis as passivators.
- ❑ As an additional benefit, modified biochar can strengthen its capability of immobilizing heavy metals.
- ❑ The efficiency is expected to be improved through the regulation of process conditions and type of additives.

Implications

- ❑ Biochar's primary and main significance has always been carbon sequestration.
- ❑ A novel idea that “high-carbon-sequestration-capacity” biochar can be designed during the charring process.
- ❑ Modifications might change biochar's physicochemical properties. These changes may have additional benefits to soil.

Study progress

What we did:

- ❑ Effect of different biomasses
- ❑ Effect of different additives
- ❑ Effect of pyrolysis conditions
- ❑ Part of instrumental characterization: TGA, XPS, XRD.

Ongoing work

- ❑ The CO₂ emission of soil incubation is still in monitor
- ❑ Effect of pyrolysis conditions
- ❑ Characterization of modified biochars including physicochemical properties and instrumental characterization such as FTIR, BET and SEM.

Thanks
